The first man-made satellite to leave the Earth's atmosphere and orbit the Earth, the first man-made satellite to carry people, and the first man-made satellite to send a man to the Moon, were achieved as a result of 12 years of fierce development competition between the winners of World War II, the United States and the Soviet Union. The greatest project in the history of space exploration was the result of 12 years of fierce competition between the winners of World War II, the United States and the Soviet Union, to develop the technology.

It is an undeniable fact that the development of powerful rockets was the basis for the development of intercontinental ballistic missiles capable of launching atomic bombs into each other's countries. It is also a fact that behind this development competition that required enormous funds, there were impoverished citizens in both countries!

However, it is also true that the result of this space race was the enthusiasm of not only the people of the two countries but also of the entire world. Below I would like to look back on this history
